### Abstract

Hair growth disorders, as perceived by legendary Ayurvedic trinity i.e. Caraka Saṃhitā, Suśruta Saṃhitā and Aṣṭāṅga Hṛdayam, referred to as *Bṛhatrayī* are caused mainly due to Vāta imbalance factors. *Mādhava Cikitsā* (a limitedly studied treatise), another Sanskrit medical compilation by Acharya Mādhava, who is considered to be the epitome of Ayurvedic patho-physiology (*Roga Nidāna*) also had emphasized treatments to hair problems under *Kshudrarog Cikitsā* like in *Bṛhatrayī*. A critical study was undertaken to find out and assign the correct botanical identification of each medicinal plant described in Sanskrit names in these treatises for the treatments of hair disorders such as *Palita* and *Khalita* along with *Indrabidda/Īndralupta* (alopecia areata, totalis universalis) under *Kshudrarog Cikitsā*. This study of the Sanskrit texts of *Bṛhatrayī* and *Mādhava Cikitsā* as made independently and in comparison, compiled a list that contains a maximum 43 identified plant species belonging to 31 families of ethnomedicinal interest. There are 05 different plants identified from the description of *Mādhava Cikitsā* only, which are not mentioned in the *Bṛhatrayī*. For *Khalita* treatment, there are 11 different plants identified from the verses of *Bṛhatrayī*, and those are not mentioned in *Mādhava Cikitsā*. A local market survey of hair oils prepared by different Ayurvedic Pharma companies found using a maximum of 84 numbers of plants in different proportions as listed in the treatises. Effort was also made in assigning the most probable botanical identifications to the plant names, and representing the plant names expressed in Sanskrit with Unicode diacritical marks in this scientific publication for universal understanding and correct pronunciation. The findings and representations in this paper will be of significant use for the Pharma companies to identify and use correct plant species for better efficacies.

**Keywords:** Hair loss, Alopecia, *Palita*, *Khalita*, Medicinal plants, *Kshudraroga*, *Bṛhatrayī*.

### Introduction

Medicinal plants are listed in various indigenous medical/health care systems, such as Siddha (600 plants), Ayurveda (700 plants), Amchi (600) (“Tibetan medicine”), also known as the *Amchi System of Medicine* in Ladakh and commonly known as *Sowa-Rigpa*, has similarities with Ayurvedic medicine in India and it is the traditional medicine in many parts of the Himalayas), Unani (700 plants) and even in Allopathy (30 plant species) for dealing with various ailments<sup>1</sup>.

The holistic aims are to heal the sick and prevent disease, sustain quality and length of life. Ayurveda is one of the most ancient medical traditions practiced in India, Sri Lanka and other south Asian countries. It has a sound philosophical and experiential basis<sup>2</sup>.

Caraka Saṃhitā, Suśruta Saṃhitā and Aṣṭāṅga Hṛdayam (*Bṛhatrayī*) are its main classics, giving detailed descriptions of uses of over 700 herbs for various treatments of diseases. Its literature describes over 200 herbs, Minerals and fats to maintain and enhance the health and beauty of the skin<sup>3</sup>.

Like authors of *Bṛhatrayī*, Mādhava [belonged to Ca 7<sup>th</sup> - 8<sup>th</sup> century CE<sup>4</sup>, popularly known as Mādhavacārya, has also been acknowledged as one of the finest Ayurvedic physicians even today. He was the author of a text on medical diagnostics (*Rogavinischaya*), known as ‘*Mādhavanidānam*’. His other classical text was *Mādhav Cikitsā*. These classical medicinal texts have made invaluable services to human and animal lives from ancient time to modern days in India.

In Ayurveda, hair diseases are described and treated under three types as *Khalita* (loss of hairs), *Palita* (premature hair graying), and *Indrabidda/Īndralupta* (white patches of hair fall on scalp - as alopecia areata, totalis universalis)<sup>5</sup>. These are counted as *Kshudraroga*. According to the American Hair Loss Association, hair loss in women affects roughly 50% population. 40% of men have noticeable hair loss by age 35; 65% by age 60 and 80% by age 80. Male pattern baldness and female pattern hair loss are the most common conditions in the present population<sup>6</sup>.

Loss of previously existing scalp hair is termed as alopecia. This is of two types, permanent and temporary. Androgenetic alopecia (male pattern baldness), which is common, has

androgen and genetic background as the cause for developing alopecia<sup>7</sup>. It is transmitted as an autosomal dominant trait. It occurs in appropriate age. Thus, scalp hair is normal in childhood and adolescence. Universally this is an extremely common disorder that roughly 50% men and perhaps as many women older than 40 years are involved. Almost all patients have an onset prior to age 40 yrs, although many of the patients (both male and female) show evidence of the disorder by age 30 yrs<sup>8</sup>.

Hence, hair disorder has become a major concern of doctors for restoring normalcy in the patients. The correct study, analysis and identification of medicinal plants from Ayurvedic texts have been showing many good results for the treatments of other chronic disorders. In a similar prospect, treatment for hair disorders (*Khalita*, *Palita* and *Indrabidda/Indralupta*) as described in the *Brhatrayi* and *Mādhav Cikitsā* need a coordinated study/research and attention of researchers, doctors and pharma companies.

But unfortunately, many ambiguities are found over the correct botanical identification of Sanskrit names of plants described in the Ayurvedic texts due to many reasons, which has caused adulteration and no effect of the herbal drugs<sup>9</sup>. World Health Organization also currently encourages, recommends and promotes traditional herbal medicines in national health care programmes; as such drugs are easily available at low cost and inherently safer than the potent synthetic drugs<sup>10</sup>.

The present study would help all concerns for the findings and correct botanical identification of Sanskrit plant names as per latest world order.

## Methodology

Ancient medical texts - Caraka Saṃhitā (CS), Suśruta Saṃhitā (SS) and Aṣṭāṅga Hṛdayam (AH) (*Brhatrayi*) and *Mādhav Cikitsā* (MC) were studied from their recently published hard copy editions<sup>11-14</sup> to enlist and identify correct botanical names of plants from the chapters under *Kshudraroga* and from the verses on *Khalita*, *Palita* and *Indrabidda/Indralupta*. Sanskrit medical glossaries, dictionaries and commentaries were studied for correct understanding of the Sanskrit names of plants indicated in the complex verses. Similarly, Indian pharmacopoeia, Ayurvedic Pharmacopoeia of India (API)<sup>15</sup>,

Ayurvedic Formulary of India (AFI)<sup>16</sup>, publications from AYUSH, CSIR<sup>17</sup>, and current taxonomic guidelines based on ICBN are referred to justify the correct botanical identifications of the listed plant species. In the table information of the plants, scientific name, family, vernacular name and Sanskrit name have been described for each species. The figures in the parentheses represent the authors in references who agree with this identification of the plant. Ayurvedic practitioners were in continuous interaction for the coordinated analysis of the texts and identification of drug parts.

## Result and discussion

This study has attempted to highlight medicinal plants described for the treatments of *Kshudraroga* in the classical Sanskrit medical texts. The knowledge of medicinal plants used by the common people from ancient times is well known due to the culture and traditions in India apart from the Ayurvedic practitioners. It was interesting to note that some of the plants as listed in *Brhatrayi* are not mentioned in *Mādhav cikitsā* and vice versa (Table 1-4). The comparative study of medicinal plants given in *Mādhava Cikitsā* and *Brhatrayi* shows that there are total 43 plant species belonging to 31 families, which were considered independently and has only one plant group (Table-4).

The results also show that 27 species (63%) were used for *Palita* treatment; 13 species (30%) for both *Palita* and *Khalita* treatment and 21 species (49%) for *Indralupta* treatment. There appears a great deal of uses of medicinal plants in the treatment of *Kshudraroga*. However, *Mādhava Cikitsā* quoted verses treating of hair problems like *Palita* and *Indralupta* rather than *Khalita*. (Table-2). Similarly, eleven plants are separately given in *Brhatrayi* only (Table-3) for the hair disorder treatment. The habit diversity of these medicinal plants shows 12% climbers, 16% shrubs, 37% trees and 35% herbs.

The most probable and correct botanical identification of each plant (along with its synonyms) was also determined through literature survey and study of Ayurvedic formulary<sup>16</sup>. The official Sanskrit names of the medicinal plants used in *Kshudraroga* as given in the tables are as per API / AFI to avoid ambiguity. Hair disorders are effectively corrected with Ayurveda therapies – say pharma companies<sup>31,35</sup> and have mentioned 30 Number of plants in their products, which are mentioned in the Sanskrit Medical texts studied. At the same time, new plant names (about 84) are added to the oil preparations for hair disorders by pharma companies, which are not mentioned in the classical texts. Further study could establish the reasons of new inclusions. However, the Ayurvedic medicinal market products show many discrepancies with respect to plant taxonomic identities, correct representations of Sanskrit and botanical names, parts used, quantity and forms of the components, etc. (Table-5). There is no mention of the texts from which the preparations are made for reference too.

Ayurvedic medical practitioners, Pharmaceutical researchers and other researchers interested in herbal drugs have been studying various medicinal plants described in different post classical ayurvedic literature. Some of their publications<sup>27,33,34,36</sup> have thrown light on herbal preparations in rejuvenating hair growth etc. This present study will certainly benefit to Ayurvedic practitioners and pharmaceutical companies in selecting proper plant species for drug formulation and biotechnological methods of harvest, which will improve the efficacy of the marketed oil products or plant extracts dealing different hair problems.

**Table-1:** Plants for *Kshudrarog Cikitsā* common in *Bṛhatrayi* and *Mādhava Cikitsā*.

| Botanical Name  | Sanskrit name   | Vernacular names  | Name as AFI/API    |
|---|---|---|--------------------|

## Conclusion

This study has conclusively emphasized the variations observed between the guided medicinal plants in the Sanskrit medical text and the marketed hair oils by pharma companies. The wrong narration of botanical identities of plant names are also been highlighted to create awareness on the real and adulterant crude drug samples.

## Acknowledgement

We are thankful to the Ayurvedic practitioners of Latur city for their help while carrying out this study and for sharing their knowledge on the use of medicinal plants with us. Without their contribution, this study would have been incomplete.
