Abstract

The tribal dominated Koraput district of Odisha has rich tradition of nature conservation through cultural and religious practices. Though maximum number of sacred groves has been reported from Koraput, there is hardly any scientific documentation of plant species in them. The present study has documented floral diversity and uses of 94 sacred plant species distributed in 63 genera belonging to 43 different families from 6 different sacred groves in a systematic manner. Most of the plant species are distributed under *Caesalpiniaceae* followed by *Asteraceae* and *Combretaceae*. The plant species are distributed in 48 trees, 26 shrubs and 21 herbs. Many of the plant species are used as herbal medicines (39%) by the tribals followed by religious importance (23 %), and food (13 %) plants. Some existing threats related to the sacred groves as well as plants under threat categories have also been recorded. While only plant species *Pterocarpus santalinus* comes under IUCN endangered category and 3 species of plants *Shorea robusta*, *Buchanania lanzan* and *Woodfordia fruticosa* comes under low risk and least concern categories whereas 6 species are under least concern category. The plants under vulnerable categories are *Ageratum conyzoides*, *Dalbergia latifolia*, *Delonix regia*, *Pterocarpus marsupium*, *Santalum album* and *Saraca asoca*. Thus, for assessing the ecological role of sacred groves and formulating strategies for their conservation, a holistic understanding of their structure and function as well as their current status is essential.

Keywords: Biodiversity conservation, herbal medicines, floral diversity, sacred groves.

Introduction

Sacred groves are tracts of virgin forest harbouring rich biodiversity and are protected by local communities to keep them in a relatively undisturbed state¹. These are the small patches of relic forest, protected by local communities on religious ground, which are the traditional Indian way of *in situ* conservation of biodiversity². Various indigenous communities dedicate sacred groves to the local deities or ancestral spirits. Such a grove may consist of a multi-species, multi-tier primary forest or a cluster of trees, depending on the history of the vegetation. These groves were protected by local communities, usually through customary taboos and sanctions with cultural and ecological implications¹.

Many rare and endemic wild plant species having potential benefit to man in medicine, agriculture and industry have been preserved in sacred groves. Sacred groves are the good source of a variety of medicinal plants, fruits, fodder, fuel wood, spices, etc.^{3,4}. In India, the sacred groves were reported earlier from the Himalayas, North-east India, highlands of Bihar, Orissa, Madhya Pradesh, Andhra Pradesh, Karnataka, Tamil Nadu and Kerala, particularly where the indigenous communities live. The floristic and ethno-botanical aspects of sacred groves in India has been dealt by earlier workers^{4,9}. Several plants and animals that are threatened in the forest are still well conserved in some of the sacred groves. It has been observed that several medicinal plants that are not to be found in

the forest are abundant in the sacred groves. Further, rare, endangered, threatened and endemic species are often concentrated in sacred groves. The sacredness, religious beliefs and taboos play a significant role in promoting sustainable utilization and conservation of flora and fauna of the region. However, with the passage of time, considerable changes have taken place in the extent of the sacred groves, in their vegetation structure, peoples' perception towards them.

Koraput district of Odisha, India is the home for a number of tribal communities and all have their own culture, customs, traditions and practices in connection with the rituals of their life cycle. The religious beliefs of the tribals are specific to each group. Among most of the tribes, the deities are believed to reside in sacred groves and even the village goddesses are worshiped under a tree at the outskirts of the village. They show utmost respect to these places and preserve them like precious treasure¹⁰.

The maximum number, 322 sacred groves, were recorded from Semiliguda block of Koraput district⁸. The biodiversity studies of sacred groves of Koraput district by earlier workers are incomplete and scanty and there is a lack of systematic study on floral diversity and its importance of sacred groves. Keeping in view of above points, the present paper deals with the systematic study on floral diversity and its importance of some selected sacred groves of Koraput, Odisha.

Material and Methods

An ethno-botanical exploration was made to find out the floristic diversity and the importance of some selected sacred groves of Koraput Forest Division (Odisha) during 2013-14. Field studies were undertaken in different sacred groves of Koraput during this period (figure-1).

Study site: Koraput is the Southernmost district of Odisha lies between 18° 14' to 19° 14' N latitude and 82° 05' to 83° 25' E longitude with a total geographical area of 8, 807 sq. km (accounting 5.38% of Odisha state), Physiographically it is contiguous to the main land of Eastern Ghat, High land zone and South-Eastern Ghat zone¹¹. The general topography varies from plain lands to high hills, with elevation gradients of 300 m to 1000 m above mean sea level. The highest mountain peak of Odisha i.e. Deomali (1672 m) lies in this district. The predominant soil type of the entire district is sandy and clay. The area is characterized by tropical to sub-tropical climate. Four distinct seasons are generally experienced here. Koraput receives an annual rainfall of 1500 mm. High humidity is experienced especially in monsoon and post monsoon months.

Observation, documentations and plant identification: Floral diversity observations were carried out in six selected sacred groves of Koraput with documentation on the history, size and location of the grove, rituals performed in the groves and GPS

readings were taken for each site. Ethno-botanical information was gathered through oral interviews of the local people, especially older persons. All gathered information was cross-checked with people of other villages and other individuals practicing in or near the locality in which the plant materials were collected. Also, comparison was made between the information provided by the people and the available literature. The plants were identified as per flora of Orissa by Saxsena and Brahumam¹². Efforts have been made to collect plants in flowering and fruiting condition and have been provisionally identified by consulting the regional floras. The unidentified plants were collected in polythene bags and taken into the laboratory and were identified with the help of herbarium of Regional Plant Resource Centre, Bhubaneswar, India.

Results and Discussion

Floral Diversity and Ethno-botany of sacred species: In the present study six sacred groves of Koraput Forest division were documented and the study indicated that these small forest patches of Sacred Groves play an important role in the conservation of biodiversity. Furthermore, natural sacred sites are maintained in a traditional way of life, as community based conservation, which does not require governmental involvement. The collected data on floral diversity and their ethno-botanical importance was presented in table 2, 3 and 4.

1- Alligam Sacred Groves; 2- Maulimaa Sacred Grove; 3- Bhairabguda Sacred Grove; 4- Dudhari Sacred Grove; 5- Mali Dusara Sacred Gove; 6- Kanta Baunsuni Sacred Groves.

Based on the reconnaissance survey of above selected sacred groves of Koraput revealed that there are 94 plant species distributed in 63 genera belonging to 43 different families (table 2, 3 and 4). In most of the sacred groves the first story of vegetation mainly consists of *Azadiracta indica*, *Ficus racemosa*, *Ficus religiosa*, *Bombax ceiba*, *Artocarpus heterophyllus*, *Mangifera indica*, *Diospyros malabarica*, *Acacia nilotica*, *Pterocarpus marsupiums* etc. The second story mainly consists of *Syzygium cumini*, *Cassia siamea*, *Melia azedarac*, *Pterocarpus marsupium*, *Cassia siamea*, *Lannea coromondelica*, *Terminalia belirica* and *Phyllanthus emblica*. The ground layers mainly contain the herbaceous plants and climbers. Most of the sacred species comes under the Caesalpiniaceae followed by Asteraceae and Combretaceae (figure-2). The sacred plants are distributed in 48 trees, 26 shrubs and 21 herbs. From the interaction with local inhabitants the importance of sacred plants have been documented and presented in figure-3. Among the plants documented, higher percentage of plants are used as herbal medicines (39%),

followed by religious importance (23%), food (13%), economical (17%) and ornamental (7 %) purposes. The plants like *Terminalia belirica*, *Achyranthus aspera*, *Citrus aurantifolia*, *Buchanania lanzan*, *Caesalpinia pulcherrima*, *Calotropis gigantea*, *Calycopetris floribunda* and *Lannea coromondelica*, are commonly used as herbal medicines. Most of the sacred tree species are of religious importance and the plants like *Ficus benghalensis*, *Ficus racemosa*, *Ficus religiosa*, *Grevilla robusta*, *Bambusa bambos*, *Bambusa tulda*, *Artocarpus sheterophyllus*, *Mangifera indica*, *Phyllanthus emblica* are the major trees species which are worshiped by the tribal's and remain conserved as these have remain uncut since many years in the groves. The present study reveals that sacred groves of the Koraput are endowed with a large number of medicinal plants. In fact sacred groves represent a good model of *in situ* conservation of biodiversity and act as the gene pool of a variety of important species. The proper identification of medicinal plants has a vital role in their sustainable utilization and conservation in the groves as well as in forest^{13,14}.

Figure-2
 Distribution of plants according to their family in different sacred groves of Koraput

Figure-3
 Different uses of plants present in different sacred groves of Koraput and their importance

The depletion of biodiversity has been considered as one of the most conspicuous effects of ecosystem perturbation. Disappearance of species due to habitat alteration, over exploitation, pollution, global climate change and invasion of exotic species is so fast that many valuable taxa may vanish even before they are identified and their scientific value is discovered. In the present study only plant *Pterocarpus*

santalinus comes under IUCN endangered category and 3 plants *Shorea robusta*, *Buchanania lanzan* and *Woodfordia fruticosa* come under low risk and 6 species are found in least concern (table 5) category. The plants of the sacred groves comes under vulnerable categories are *Ageratum conyzoides*, *Dalbergia latifolia*, *Delonix regia*, *Pterocarpus marsupium*, *Santalum album* and *Saraca asoca*.

Table-5
List of Plants in IUCN categories present in the sacred groves of Koraput.

Sl. No	Name of the plant	IUCN Status
1	<i>Acacia auriculiformis</i> A. Cunn.	Least concern
2	<i>Ageratum conyzoides</i> L.	Vulnerable
3	<i>Bauhinia purpurea</i> L.	Least concern
4	<i>Buchanania lanzan</i> Spreng.	Low risk/Least concern
5	<i>Centella asiatica</i> L.	Least concern
6	<i>Colocasia esculenta</i> L.	Least concern
7	<i>Dalbergia latifolia</i> Roxb.	Vulnerable
8	<i>Delonix regia</i> Boj.	Vulnerable
9	<i>Marsilia minuta</i> L.	Least Concern
10	<i>Mimosa pudica</i> L.	Least concern
11	<i>Pterocarpus marsupium</i> Roxburgh.	Vulnerable
12	<i>Pterocarpus santalinus</i> L.f.	Endangered
13	<i>Santalum album</i> L.	Vulnerable
14	<i>Shorea robusta</i> Roth.	Low risk/List concern
15	<i>Saraca asoca</i> Roxb.	Vulnerable
16	<i>Woodfordia fruticosa</i> L.	Low risk/Least concern

Conclusion

Koraput is blessed with rich and diverse cultural heritage associated with sacred species of plants in sacred groves. These sacred groves not only enhance the economic status of the local tribal communities but also safeguard the germplasm wealth *in situ*, which are in the verge of elimination. Though enough research has not been made on the sacred groves of Koraput, today the conservation practices of the tribals in Koraput has played an important role as valuable store house of biodiversity containing innumerable kinds of endemic and endangered plants that have been conserved in these forests. The present information is helpful in formulating the conservation strategy of sacred groves by the government agencies and non government organisations and creating awareness among the local people for the conservation of biodiversity. Thus, for assessing the ecological role of sacred groves and formulating strategies for their conservation, a holistic understanding of their structure and function as well as their current status is essential.
