Abstract

The objective of this paper is to analyze the performance of 12 public and private sector banks over a period of eleven years (2000-2011) in the Indian banking sector. For this purpose, CAMEL approach has been used and it is established that private sector banks are at the top of the list, with their performances in terms of soundness being the best. Public sector banks like Union Bank and SBI have taken a backseat and display low economic soundness in comparison.

Keywords: CAMEL approach, public and private sector banks

Introduction

The Indian banking sector has been the backbone of the Indian economy over the past few decades, helping it survive various national and worldwide economic shocks and meltdowns. It is one of the healthiest performers in the world banking industry seeing tremendous competitiveness, growth, efficiency, profitability and soundness, especially in the recent years.

Various aspects of the Indian banking sector have been highlighted in recent studies. Many of these refer to convergence and soundness of the sector. There has been a lot of literature covering both of these aspects and, to a great extent, establishing different relationships between these and key macroeconomic and financial variables.

Convergence, as regards to Indian banking, could refer to the convergence between various categories of banks including public sector banks, old and new private sector banks, foreign banks etc. or to the convergence of the existing accounting standards in the country with the internationally accepted accounting standards (IFRS). In the former case, various studies based on different econometrics parameters have been conducted to show a pattern that is emerging in this sector where increased privatization and competitiveness are leading all kinds of banks to an optimum performance and efficiency level, or in other words, banks are converging to an optimum efficiency level. As regards to the latter, the RBI and the Institute of Chartered Accountants of India (ICAI) have decided to converge the current Generally Accepted Accounting Principles (GAAP) and the International Accounting Standards (IAS) with the now internationally accepted and widely implemented International Financial Accounting Standards (IFRS) for various different reasons, the most important being India’s increasing participation in global markets.

Soundness is a key factor in any financial sector. One of the major measures of economic development and financial growth of a country has been the soundness of it banks. Soundness of the banking sector is synonymous with efficiency, productivity, profitability, stability and a shock free environment. Achieving stability in banking is only the beginning of a sound banking system. The main goal of banks today is to maintain stability and make sure they are impervious to external shocks while at the same time being internally sound and sensible. Hence, it is important to measure soundness across various banks in the country, identify the weaker sections of the banking sector, devise appropriate strategies and policies to lift these sections and eventually create an environment that leads banks to converge in soundness and result in a consistently stable system.

This study analyzes the various aspects of convergence and soundness in the Indian Banking sector, computes various factors affecting and determining the two using econometric analysis and provides policy suggestions on tackling obstacles encountered while achieving soundness and convergence and how to maintain stability for longer periods.

Review of Literature: The paper by Prasad et al. deals with financial soundness in the Indian banking sector using the CAMEL model. Both papers have selected certain PSBs and NPBs on some criteria and both suggest that the Indian Banking is sound overall, but the authors themselves only rank various banks in order of soundness while not making a conclusive statement about soundness of the banking sector as a whole. On similar lines, Manoj P. K. has written a paper on application of ‘CAMEL’ approach to OPBs with special reference to Kerala OPBs. His conclusion is that OPBs lag the most as regards to soundness in banking and remedial measures be quickly adopted by these, but the paper doesn’t describe the method to achieve better soundness. Reddy and Prasad have applied the ‘CAMEL’ approach to Rural Regional banks in India and used hypothesis testing aided by the t-statistic to distinguish between two classes of these banks. However, this could have been extended to other banks in the country.
Papers by Gupta and Jain, Singh, Satoshi Shimizu and Ghosh and Ghosh use parameters like Return on Assets, NPA Ratio, and Capital Adequacy Ratio etc. to measure soundness of Indian banks and compare with that of the world. (1), (2) and (4) highlight a lower degree of leverage, higher stability in ROA and decreasing NPA ratios leading to soundness in Indian banking. Most of (1) and (4) deal with NPAs without highlighting further soundness estimators. (2), (3) and papers by Raghavan(2003) and Sharma(2009) talk about Basel-II analysis associated with risk management and explain its relationship with soundness, with the main focus on a higher CRAR for better soundness. Sen Gupta’s paper deals with the introduction of Basel III norms post the 2008 financial crisis, the challenges associated with their implementation but doesn’t specify how much of Basel III should India adopt. He concludes that maintenance of financial stability requires constant vigilance and proactive measures but doesn’t delve deep into the procedure required for the same.

The paper by Gupta et al and another by Das et al examine the performance of the Indian banking sector using the non-parametric frontier: DEA – Data Envelopment Analysis and further finding the productive efficiency using the TOBIT model. Through these, it was found that the efficiency increase in the private bank sector has come from the small banks. Using capital adequacy ratio analysis, the paper finds that an increase in CAR results in higher productive efficiency which stems out of high profitability of banks and thus better soundness.

Paper by Shahchera and Jouzdani investigates the impact of regulation on sound banking. The authors measure the Z-score of soundness and suggest more transparency and better information exchange for sound banking. They also prove the shape relationship between regulation of banking and financial soundness.

The paper by Ghosh analyses the performance of the previously owned state-owned banks after the partial privatization. Privatization improves bank soundness, enhances profitability and efficiency. Government ownership has been empirically proven to be detrimental to growth. It was synonymous to higher spread, lower resources to lend and a low activity on the stock market. Apart from the above measures, the paper by Shirai highlights the impact of diversification of banking activities. It dilutes the impact of direct lending and thus enhances the soundness by encouraging the banks to function properly.

Goyal in his paper analyses the various risk management measures and strategies in place in India owing to increase in competition, deregulation, innovative financial instruments and delivery channels. Market discipline improves safety and soundness in banks and financial systems. Das, in his paper analyses that, while the profitability of all banks went up, the profitability of foreign banks was higher. The main aim of these reforms was to enhance the soundness and this was seen through credit deposit ratios; wherein a higher ratio depicted greater soundness. The asset quality was indicative of the structural soundness of the banks which was higher in PSBs whereas the financial soundness in terms of profitability was higher for Pvt. Sector banks (ROA and ROE). The paper by Chaudhry and Singh analyzes the impact of the financial reforms of 1991 on the increase in soundness of Indian Banking through its impact on the asset quality. The key players to ensure this soundness are again, risk management, NPA levels, effective cost management and financial inclusion.

In another paper, Ghosh examines the interplay between credit growth bank soundness and financial fragility in Indian banks. The soundness of banks is measured by their distance to default. Loan growth is often directly associated with soundness but and an extension could weaken bank soundness. Also high growth in the private sector credit augments bank soundness. The paper by Santha also highlights the importance soundness on the economic development of a country. It draws a direct relation between the integrity system, the capacity to innovate and the soundness of the banks. It throws light on the importance of intellectual capital and infrastructure amongst the other factors. Due to variation in the drivers for soundness, the gap in soundness between developing, UDCs and developed countries is wide. Empirical analysis using OLS show that there is a positive yet insignificant relationship between infrastructure and intellectual capital and soundness, while it is significant with regards to institutions and integrity.

**Research Methodology**

To look at the financial soundness and infer about convergence of the commercial banks operating in India we use a very simplified approach using internationally accepted CAMEL rating parameters.

CAMELS is an acronym for six measures (capital adequacy, assets quality, management soundness, earnings, liquidity, and sensitivity to market risk). In this analysis the six indicators which reflect the soundness of the institution framework are considered.

Twelve commercial banks were selected purposively for the study. The banks selected for the purpose for the study are traded in National Stock Exchange and are part of CNX bank Index (http://www.nseindia.com/content/indices/ind_cnxbank.htm) CNX Bank Index is an index comprised of the most liquid and large capitalized Indian Banking stocks. It provides investors and market intermediaries with a benchmark that captures the capital market performance of the Indian banks.

The banks selected for the purpose of the study are Axis Bank Ltd, Bank of Baroda (BOB), Bank of India (BOI), Canara Bank, HDFC Bank Ltd (HDFC), ICICI Bank Ltd (ICICI), IDBI Bank Ltd (IDBI), Kotak Mahindra Bank Ltd (KMB), Oriental Bank of Commerce (OBC), Punjab National Bank (PNB), State Bank of...
India (SBI) and Union Bank of India (Union Bank). Once soundness across banks is determined using the CAMEL model, inferences can be drawn regarding convergence across these banks based on the model.

The ratios depicting the CAMEL parameters were calculated based on the publicly available information published at Reserve Bank of India, Indian Bankers’ Association and Moneycontrol.com. The paper referred to for further details, analysis and data for the year 2011. The CAMEL parameters are discussed in the following section

**Capital Adequacy Ratio**: Capital adequacy ratios ("CAR") are a measure of the amount of a bank's core capital expressed as a percentage of its risk-weighted asset.

Capital adequacy ratio is defined as

\[
\text{CAR} = \frac{(\text{T1 Capital} + \text{T2 Capital})}{\text{Risk weighted Assets}}
\]

TIER 1 CAPITAL = (paid up capital + statutory reserves + disclosed free reserves) - (equity investments in subsidiary + intangible assets + current and f losses)

TIER 2 CAPITAL = i. Undisclosed Reserves, ii. General Loss reserves, iii. hybrid debt capital instruments and subordinated debts where risk can either be weighted assets (a) or the respective national regulator's minimum total capital requirement. If using risk weighted assets,

\[
\text{CAR} = \frac{[\text{T1 + T2}]}{a} \geq 10\
\]

percent threshold varies from bank to bank (10% in this case, a common requirement for regulators conforming to the Basel accords) is set by the national banking regulator of different countries.

Two types of capital are measured: tier one capital (T1 above), which can absorb losses without a bank being required to cease trading, and tier two capital (T2 above), which can absorb losses in the event of a winding-up and so provides a lesser degree of protection to depositors.

**Asset Quality**: To account for the extent of Non Performing Asset in the portfolios of the banks and the extent of damage this particular asset class can have on the financial performance the following ratio is considered for the purpose of analysis.

**Net NPA to Net Advances**: The ratio portrays the quality of the asset class in the portfolio and the also the extent of deterioration of the quality of the asset portfolio. This dimension of CAMEL analysis conveys the portfolio risk the bank is subjected to and the effects it could have in the overall performance of the bank.

**Management Quality**: The management dimension in CAMEL analysis has assumed much important position like never before.

To capture the possible dynamics of management efficiency affecting the financial performance of the banks the following ratios are considered. i. Market Value to Equity Capital, ii. Total Advances to Total Deposits. iii. Business Per Employee, iv. Profit Per Employee

**Earnings Quality**: Banks depend on their strong capability of earnings for performing the activities like funding dividends, maintaining adequate capital levels, providing for opportunities of investment for bank to grow, strategies for engaging in new activities and maintaining the competitive outlook.

However apart from the sources of earning, the following dimensions also decide significantly the financial performance of the banks. i. Level, trend, and stability of earnings, ii. Quality and sources of earnings, iii. Ability to augment capital through retained earnings. iv. Exposure to market risks. v. Provisions for loan losses

**Liquidity**: Liquidity management in banks has assumed prime importance due to competitive pressure and the easy flow of foreign capital in the domestic markets. The impact of liquidity crisis in the banks can adversely impact the financial performance of the banks. Inability of the banks to manage its short term liquidity liabilities and loan commitments can adversely impact the performance of the banks by substantially increasing its cost of fund and over exposure to unrated asset category. Also the cash flow from principal and interest payments could vary due to the types of loans on the balance sheet impacting the liquidity position.

To capture the impact of liquidity on the financial performance of the banks two ratios are considered. i. Liquid assets to total assets. ii. Liquid asset to total deposit

Based on the values of the ratios the selected banks will be ranked. Higher average value of the ratios gets ranked higher. The best ratio gets rank one followed up to rank twelve with an interval of one. In case of tie the average rank is assigned to the banks. All the ratios having higher value get higher rank whereas the ratio Net NPA to Total Asset gets the rank in reverse order. Higher Net NPA to Total Asset ratio attracts lower rank as well.

**Results and Discussion**

The overall ranking of the banks considering all the sub criteria rankings under CAMEL analysis over the eleven years period (2000-2011) is presented in the Table 1-6. The group rankings
of all the banks considered for the purpose of study is taken and averaged out to reach at the overall grand ranking (table 6). HDFC is ranked first under the CAMEL analysis followed by ICICI. Axis Bank occupied the third position. The fourth position is occupied by IDBI and KMB jointly while Bank of Baroda and PNB follow. The last position under CAMEL analysis is occupied by Union bank amongst all the selected banks during the year 2000-2011.

Conclusion

Here we have obtained a ranking of various Indian banks’ in terms of their CAMEL variable values. Ranking the commercial banks is difficult to the extent that any type of ranking is subject to criticism as the ratios used for the purpose of ranking can be interpreted in the way one likes. This method of analysis provides a simplistic, reader friendly version of presenting complex data regarding performance of a set of players in the banking industry. The ranking system makes judging and analysing the financial data of banks much simpler for the common man. Thus through this particular data set, it can be established that private sector banks are at the top of the list with their performances in terms of soundness being the best. Public sector banks like Union Bank and SBI have taken a backseat and display low economic soundness in comparison. This implies that the Government needs to focus more on the Public Sector Banks in order to increase the net profit to average assets ratio, profit per employee etc. Although these will be good for the soundness of the bank, it may defeat the purpose of Public Sector Banks lending at comparative lower rates.

As for convergence, using parameters of the CAMEL model, we can see that the private sector banks are heading towards convergence, not in the short, but in the long run. Most of these banks, including ICICI, Axis, HDFC lie in a similar rank region. However, these banks’ assets etc. vary a great deal and they cannot be judged solely based on the absolute values of the CAMEL ratios. Looking at the trend, we can say that private banks are growing at a faster pace than public sector banks and will head towards convergence faster than the PSBs.
