## Abstract

A simple, rapid and accurate high performance liquid chromatography method is described for simultaneous determination of aceclofenac and thiocolchicoside from combined dosage form i.e. tablets. The separation of drug was achieved on Polaris C18 (150 x 4.6 mm i.d.) with 5  $\mu$  particle size, column showed most favorable chromatographic pattern over the other columns. The mobile phase consisted of a mixture of buffer and acetonitrile (55:45 % (v/v)). The buffer was 0.01 M ammonium acetate solution adjusted the pH 3.4 with ortho-phosphoric acid. The detection was carried out at wavelength 270 nm. The mixture of buffer of pH 3.4 and acetonitrile (55:45% v/v) was used as a diluent. The method was validated for system suitability, linearity, accuracy, precision, robustness, stability of sample solution. The method has been successfully used to analyze aceclofenac and thiocolchicoside from combined dosage form i.e. tablets.

Keywords: Aceclofenac, Thiocolchicoside Acetonitrile, Ammonium acetate, Ortho phosphoric acid.

## Introduction

Aceclofenac, chemically {[[2-[(2,6-Dichlorophenyl) amino] phenyl] acetyl]oxy}Acetic acid. It is the non steroidal anti inflammatory, analgesic and anti-inflammatory drug. It is used in treatment of relief in variety of painful condition.

Thiocolchicoside, a semi synthetic derivative of naturally occurring compound of colchicoside from the seeds of various species of colchicum antumnale (autumn crocus, meadow saffron, Gloriosa upuba), chemically, *N*-[(7*S*)-3-(β-D-Glucopyranosyloxy)-1,2-dimethoxy-10-(methylsulfanyl)-9-oxo-5,6,7,9-tetrahydrobenzo[*a*]heptalen-7-yl]acetamide It is centrally acting muscles relaxant and it also show analgesic activity. It is used in treatment of muscular pain and gout.

Literature survey reveals, UPLC<sup>1</sup>, HPTLC<sup>2</sup>, HPLC<sup>3</sup> and UV spectrophotometric methods<sup>3,4</sup> for simultaneous determination of thiocolchicoside and aceclofenac in combined dosage form. This proposed work presents simple, accurate and reproducible reverse phase high performance liquid chromatographic method for simultaneous determination of aceclofenac and thiocolchicoside in tablet dosage form.

## **Materials and Methods**

Chemical and reagents: Reference standard of aceclofenac and thiocolchicoside were obtained from reputed firm with certificate of analysis. Ammonium acetate, acetonitrile and ortho phosphoric acid were used of analytical grade and the HPLC grade water was used from Millipore. Standard and

sample solutions were prepared in diluent [mixture of buffer of pH 3.4 and acetonitrile (55:35 % (v/v)].

**Instrumentation:** The HPLC system used was MERCK Hitachi HPLC system equipped with auto sampler (D 7200 separation module) and UV detector (D- 7400). The chromatogram was recorded and peaks quantified by means of PC based EZ Chrom Elite software. A Shimadzu analytical balance (0.01 mg) was used.

**Standard solution:** A 100 mg of standard aceclofenac and 4 mg of thiocolchicoside and were weighted accurately and transferred in 100 ml volumetric flask. About 50 ml of diluent [mixture of buffer of pH 3.4 and acetonitrile [55:45 % (v/v)] was added and sonicated for 10 minutes. The volume was adjusted up to the mark with diluent to give concentration as 1000  $\mu$ g /ml of aceclofenac and 4  $\mu$ g /ml of thiocolchicoside respectively.

Sample preparation: Twenty tablets were weighed accurately and average weight of each tablet was determined. A powder equivalent to 100 mg of standard aceclofenac and 4 mg of thiocolchicoside were weighted accurately and transferred in 100 ml volumetric flask to give concentration as 1000  $\mu g$ /ml of aceclofenac and 4  $\mu g$ /ml. of respectively.

Chromatographic condition: Chromatographic separation was performed on a reverse phase Polaris C18 (150 x 4.6 mm i.d.) with 5  $\mu$  particle size column. The mobile phase was a mixture of buffer of pH 3.4 and acetonitrile [55:45 % (v/v)]. The buffer

Res. J. Recent. Sci.

was 0.01M ammonium acetate adjusted the pH 3.4 with orthophosphoric acid. The flow rate of the mobile phase was adjusted to 1 ml /min. The detection was carried out at wavelength 270 nm. (Figure-1). The injection volume of the standard and sample solution was set at 1.0  $\mu$ l.

**Method validation: System suitability:** System performances of developed HPLC method were determined by injecting standard solutions. Parameter such as theoretical plates (N),

asymmetry, resolution and area were determined. The results are shown in Table-1 which indicates good performance of the system.

**Specificity:** Specificity is the ability of the method to resolve the active ingredients. Hence blank, standard ofloxacin was injected to prove specificity. The typical chromatogram of the standard and sample assayed are given in Figure-2 and 3 respectively.

Overlay UV spectra of aceclofenac and thiocolchicoside

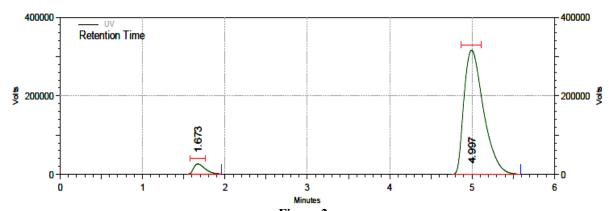

Figure-2
Typical chromatogram of Aceclofenac and thiocolchicoside (standard)

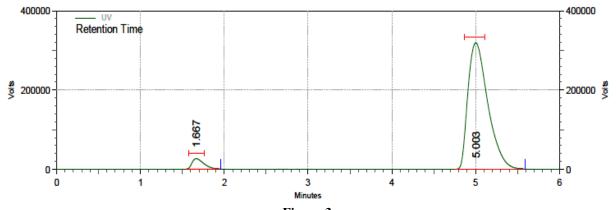

Figure-3
Typical chromatogram of Aceclofenac and thiocolchicoside (sample)

Vol. 5(ISC-2015), 85-89 (2016)

**Linearity:** Under the experimental conditions described above, linear calibration curve were obtained throughout the concentration range studied. Regression analysis was done on the peak area (y) v/s concentration (x). The regression analysis data obtained is tabulated in Table-2.

**Accuracy:** The accuracy method was determined by applying proposed method to synthetic mixture containing known amount of drug corresponding to 80 %, 100 % and 120 %. The accuracy was then calculated as the percentage of analyte recovered by the assay. The results of the recovery analysis are enclosed under Table-3, 4.

**Precision:** The method precision was established by carrying out the analysis of aceclofenac and thiocolchicoside. The assay was carried out of the drug using analytical method in five replicates. The value of relative standard deviation lies well with the limits. The results of the same are tabulated in the Table-5,6.

**Robustness:** The robustness of the method was determined to check the reliability of an analysis with respect to deliberate variations in method parameters.

The typical variations are given below: Variation in the flow rate by  $\pm$  0.2 ml/min Variation in mobile phase composition by  $\pm$  2 % Variation in wavelength  $\pm$  5 nm

The results of the analysis of the samples under the conditions of the above variation indicated the nature of robustness of the method.

Method application: Twenty tablets were weighed accurately and average weight of each tablet was determined. A powder equivalent to 100 mg of standard aceclofenac and 4 mg of thiocolchicoside were weighted accurately and transferred in 100 ml volumetric flask to give concentration as 1000  $\mu g$ /ml of aceclofenac and 4  $\mu g$ /ml. of thiocolchicoside respectively. From this solution 1.0  $\mu l$  was injected specific conditions. The analyte peak was identified by comparison with that of respective standard. The (%) assay results were expressed in Table-4, 5. It indicates the amount of aceclofenac and thiocolchicoside in the product meets the requirement.

Table-1
System suitability parameters evaluated on standard solution of Aceclofenac and thiocolchicoside

| Name             | Retention Time | Area    | Asymmetry | Resolution |
|------------------|----------------|---------|-----------|------------|
| Thiocolchicoside | 1.673          | 251164  | 1.63      | -          |

# **Result and Discussion**

The reproducibility, repeatability and accuracy of the proposed method were found to be satisfactory which is evidenced by low values of standard deviation and percent relative standard deviation. (Table-3,4) The accuracy and reproducibility of the proposed method was confirmed by recovery experiments, performed by adding known amount of the drug to the preanalyzed active pharmaceutical ingredient and reanalyzing the mixture by proposed method.

# **Conclusion**

Thus the proposed RP-HPLC method is used for estimation of aceclofenac and thiocolchicoside from active pharmaceutical ingredient and pharmaceutical combined dosage form. It is more economical, precise, accurate, linear, robust, simple and rapid method. Hence the proposed RP-HPLC method is strongly recommended for the quality control of the raw material, active pharmaceutical ingredient and pharmaceutical formulation.
